

ABOUT THIS INTERNSHIP

This internship is for students who want hands-on, real experience with Python and AI. We're software engineers first: you'll work directly with Claude Code, LLMs, and modern AI tools, alongside the team, on things we're actually building.

DAY-TO-DAY RESPONSIBILITIES

- Write Python scripts and features for things we're actually building, focused on clean, working code.
- Work across different problems as they come up. The work changes as we learn what works.
- Debug and improve code under guidance, and see your fixes actually used.
- Document what you build and what you learn, so the team can build on it.

WHAT YOU GET

- Access to Claude Code and a Claude Max subscription.
- ChatGPT Plus subscription access.
- Anthropic's Claude certification, sponsored on strong performance.
- A serious learning opportunity, with a pre-placement offer path for high performers.

This internship emphasizes learning and skill development: you'll finish it understanding modern AI better than most working engineers, with a body of work you can show.

Automated Video Dubbing System

This project turns a YouTube video into an English-dubbed version. Write a Python script that takes a YouTube URL as input (in any language, such as German, French, or Hindi), downloads the video, and produces a new version dubbed into English: same voice, same energy, same video, just with English audio.

ASSIGNMENT (REQUIRED)

- Accept a YouTube URL as input to your script (a command-line argument or a simple prompt is fine).
- Download the video from that URL.
- Transcribe and translate the video's speech into English.
- Synthesize natural-sounding English speech from the translation.
- Replace the original audio with the dubbed English audio in the final video.
- Save the final dubbed video to disk.
- Print progress to the terminal while it processes.

SUGGESTED WORKFLOW

1 **Fetch & Transcribe:** download the video from the URL and turn its speech into text.

Download the video, then transcribe the speech.

Hint: yt-dlp is the more reliable choice for downloading.

Hint: Whisper (open-source, free) is a solid starting point for transcription across languages.

2 **Translate:** carry the meaning into English.

Translate for meaning and natural phrasing, not a literal word-for-word conversion.

Hint: IndicTrans2 (open-source, free) is built specifically for translating Indian languages into English.

3 **Synthesize:** give it a natural English voice.

The voice should sound natural, not robotic, and reasonably match the original speaker.

Hint: free tools like edge-tts produce natural voices.

4 **Remix & Output:** swap in the new audio, ship the final video.

Replace the audio track in the original video (e.g. with ffmpeg) without re-encoding the visuals.

OPTIONAL ENHANCEMENTS (FOR THE AMBITIOUS)

- **Multi-speaker support:** tell different speakers apart and dub each in a distinct voice, optionally cloning the original speaker's own voice. This is a stretch goal, attempt it only if you finish the core assignment with time to spare.

Hint: look at speaker diarization (e.g. pyannote.audio) and free voice-cloning models like Coqui XTTS.

SUBMISSION

Email the following to careers@idealabsdigital.com:

- **Your dubbed videos:** run your script on two videos, a 30 minute one and a 2 hour one. For each, send the source video, the dubbed output, and how long it took to process.
- **Your walkthrough:** a 2 minute video explaining your dubs and your architecture and decisions.

EVALUATION CRITERIA

We judge every submission on exactly these two things, so you know what we're looking for and where you stand.

Accuracy: how good the dub actually is: translation quality, how natural the voice sounds, and how well it's timed to the original.

Code quality and clarity: how well-organized and readable your code is, and how clearly you explain your architecture and decisions in the walkthrough video.
